

You have a shoe-selling e-commerce platform. Now, the client wants to implement a new feature "Search". During the client meeting, they mentioned they wanted to make the search dynamic, with any keywords, or specific text. Now you have a chance to get into more details on the feature. You can ask 10 questions to the client. List the questions according to priority.

Ans:

1. What type of search do you want? Basic keyword search, filters, or advanced search?
2. Would you prefer live search results, or would you rather the results show after pressing Enter?
3. Do you want a system that suggests product names or common searches while the user is typing?
4. Would you want the search where users select filters in categories like Men's, Women's, and Kids, in brands, in price, and in size?
5. Would you like the search results to show shoes sorted by Featured, Price: High-Low or Low-High, and newest products?
6. Should the search be case-insensitive?
7. Would you like popular or trending shoes to appear on the search page?
8. Would you like the search to support multiple languages for international customers?
9. Should the search be able to handle spelling mistakes and suggest corrections?
10. Will the search results display product descriptions, reviews, and details alongside the product title?
